

Connecting Multiple Arduinos with Connect_Arduino()

1. Plug in exactly one of the Arduinos.
2. In the Command Window, type 'Connect_Arduino()'.
3. The text that prints will mention a port. On Windows, it will be 'COM<some number>'.

On Mac, it will be '/dev/tty/usbmodem.<some number>' (or something similar).
4. At the start of your code, type the following:

`Connect_Arduino('<the name you want for that Arduino>','<the port you just saw>');`
5. Repeat steps 1-4 for all Arduinos to connect.
